

HILDRETH BROS.'

BALANCED ROCKING SAW TABLE.

More Wood Sawed.

Less Labor to the Operator.

Greater Safety for Operator.
Less Danger of Broken Saws.

A Great Improvement over other Tables for
Sawing Cord Wood.

The Balanced Rocking Saw Table

has proved to be the best arrangement yet invented for sawing cord wood at Wood Yards, on Railroads and on Farms. Heretofore, portable Saw Tables have been constructed with slides and tracks for the table to slide on. Slide tables when new, if nicely fitted, operate well ; but the constant operation of sliding the table, with the unavoidable collection of grit or dust on the slides, soon wears them loose, which allows a side motion to the table when in operation, and causes the wood to bind or cramp the saw. This side motion or twist of the slide cramps the saw, makes it dangerous to the operator, uses up the power needlessly, and is very liable to break the saw. These slides also require very frequent lubrication to prevent unnecessary labor.

The Rocking Table turns on *pivots*, which are secured in boxes, and the table is held firmly in its proper position true with the saw, allowing the table to swing freely, without any liability of cramping the saw, requires only occasional lubrication, and is very durable. The table is balanced by the weight, which, by its action and reaction, assists the operator, and enables him to manipulate the wood more safely and rapidly. The weight is so adjusted and attached as to assist the operator in bringing the wood up against the saw, in making each cut ; and after the stick is sawed through, assists the operator in returning the table for the next cut. This is very desirable, especially on railroads, or wherever great quantities of wood

must be sawed, as the man at the saw is obliged to handle all the wood that the entire gang passes. The amount of wood sawed with these machines is much greater than persons unacquainted with the business could suppose. Parties who have used the old slide saw table for years, pronounce these Balanced Rocking Saw Tables far superior to any slide table ever manufactured, easier to operate, safer for the workmen, more rapid in operation, and in every way superior to any other table for the purpose.

The table rocks the wood close to the arbor, so that a 24-inch saw is large enough to cut all ordinary wood, and is the size usually furnished with the table. These tables are made very firm and solid, with steel arbor and heavy turned *web* balance wheel, thus avoiding the danger of spokes which are liable to catch the wood. The saw is covered by a box and guard iron to protect the operator. Pulley is 6 inches in diameter by 6-inch face, and should be run with belt 4 or 5 inches wide. In ordering, it is important to state whether saw shall be on *right* or *left* hand of the operator, when at work, as we make these tables either *right or left hand*.

PRICE of Long Saw Tables, with 24-inch
Saw filed and set, also extra long Wrench,
Saw Set and File,..... **\$75.00**

For further particulars regarding Saw Tables, Wood Splitters and Horse Powers, enquire of the manufacturers,
